

Page structure

Explanations of what constitutes a page in Extenso

Components of a page.

Template = responsible for fetching the master template grid and generating the page grid.

Master template = Is a page type.

Typically used to display the site header and footer or any other element that will be visible on all pages using this master template.

Grid = The grid is the content added to the page. It is the design of the page.

Page: The template

Its main task;

- Fetch the master template grid
- Generate the grid of the page created by the customer.
- Contains the basic structure of the page. <head> <body>...

Information;

- Usually always Sed_site_base_from_master unless exceptions.
- In the <head>, there is an include which takes care of generating anything related to metadata.
- Do not modify directly. It is part of the sed_site module

Page: The master template

Page type : master page

- They are created like regular pages except for the Template which is `sed_site_master`

Its main task;

- Usually used to display the site header and footer.
- Must contain the grid widget to allow editing.

Information;

- We often create a master page for some pages types.
- Example, the news. So the news master page will contain all the widgets needed to display a news. All news with this master template will have the same display.

Don't forget to install the GRID widget

If it is not installed in the master page, the customer will not be able to install any components in his page.

Exercise 1 - Creating a master page

Step 1

- Add a master page
- Add a text widget and enter MY TEMPLATE

2nd step

- Create a new page (site page).
- During creation, in Master template select the master page that you have just created.
- Activate grid editing. Nothing will be displayed if you haven't installed the grid widget.
- Edit the master template and install the Grid widget.
- Go back to your new generate page again.

Page: Why create my own template

- I want to use CSS or JS libraries which are not installed in Extenso and I have to modify the <head>
- I want to add code in the head or the body that is not related to google analytics or simple JS overlay (available in the / Client / Parameters / SEO table).
- I want to modify the code of the include header for the metas

Exercise 2 - Duplicate the template

Step 1

- In Extenso / Dev Site / Site template
- Duplicate UID 4 - sed_site_base_from_master
- Edit the entry:
 - Template code
 - Template name
 - Remove the module in the Associated module field
 - and the path of the file - /site/template/my-template.sn

2nd step

- Go to the IDE and open the new Template.
- Add a comment in the head / * TEST MY COMMENT * /
- Change your page template and post again.

Base styles

Explanation of what to do to configure the basic styles in Extenso.

Prepare the base style for the site

The style allows you to control basic elements like fonts, button colors and a Custom CSS field.

The style used is selected in the "Site parameters" table.
CLIENT / Settings /

To customize your theme, you can go to
CLIENT / DESIGN / customize your theme

You will be able to choose the font for all content levels in the **Text tab**.

In the **Button tab**, you can customize the default and action button.

In the **Custom CSS tab** you can create CSS that will be published in the styles.css resource

Add new font in Extensio

Adding new fonts is done from google font.

<https://fonts.google.com/>

The addition must be done in CLIENT / Design / Police.

Here is the information to take from Google and put in Extensio.

Value :

'Roboto', sans-serif

Code import :

`@import
url('https://fonts.googleapis.com/css2?family=
=Roboto:wght@100;300;400&display=swap');`

Preparation of color variables

The color variables are used in the different Color Palettes across extenso. It allows you to quickly change the color of a site when in use.

The addition must be done in
CLIENT / Design / **Color variables**
